Anatomy from the face

Knowledge of the anatomy of the face is essential to succeed in harmonizing surgeries. The human face is basically formed by layers of skin, fat compartments, muscle functions, vascularization and innervation. The study of the face is the basis of any procedure, from the application of superficial products, such as peelings, to deeper ones, such as hyaluronic acid, biostimulators, threads, etc.

The face is constantly exposed to the action of the weather, type of work, sports, etc. Over the years, the tissues lose their elasticity, causing loosening of the retention ligaments, consequently the fall of fat compartments that start to accumulate in the lower third of the face.

history of facial surgery

The first plastic surgeon in history, **Madame Noël fought** for gender equality since the 1st World War. Known for her efficient facelift technique, a microsurgery in which she made small incisions, followed by sutures on the scalp in order to create tension in the face, she gained recognition by redesigning the faces of important figures of the aristocracy of the time. Currently, Face Lifting (or facelift or rhytidectomy) has undergone major changes, always seeking better aesthetic and appropriate results.

But what is Face Lifting?

It is a surgical procedure that improves the signs of aging on the face. Face Lifting can simultaneously improve three-thirds of the face (forehead, cheekbones and neck), while Mini Lifting aims to address just one of these areas.

Face polluted

The main indication for you to have surgery is when your face is polluted. But how so? I am not the Tietê River. Am I not Thamisa? Polluted face is when you have difficulty seeing your features, in the sense of a lot of line, a lot of fall, or something that bothers you on your face, like your nose for example.

It is always interesting to hear the opinion of a plastic surgeon, who will indicate the appropriate treatment. Whether it's surgery, machines, facial harmonization techniques, use of threads, fillers or biostimulators.

How is it done the evaluation?

The first step is to assess your face frame, the face frame. The jaw line is also evaluated, and the drawing of the side of your face. in profile nose drop and double chin are evaluated.

Then we will see the falls of the face. Mostly eyebrow drop, drop mustache icon and puppet line drop.

It's like I set up in my head, a score, where each evaluation has a value that is added up. I mean, depending on the note, the intensity of these changes that I am seeing in you, I indicate a procedure that fits with your need. This way of evaluating was acquired with more than 30 years of experience as a surgeon.

What is the age to operate my face?

This question has no answer. You don't have an age to operate your face. You have a moment. If you are feeling down or down, aged, with a tired face, no matter what age, we will evaluate you and indicate the best procedure.

Allied technologies

BODYTITE by InMode

BodyTite by InMode is InMode's FDA-approved medical technology with tissue temperature and impedance monitoring for minimally invasive body and facial reshaping treatments with minimal surgical results and scarring.

This technology offers a 3D remodeling of the body, with a three-dimensional contraction of the dermis, subcutaneous connective tissue and deep adipose tissue, through lipolysis, providing results achieved only with traditional liposuctions.

Fractional CO2 Laser

Fractional CO2 laser is an aesthetic treatment indicated for skin rejuvenation by fighting wrinkles on the entire face and is also great for combating dark spots and removing acne scars.
