# Procedures or Plastic surgery?

It is always interesting to hear the opinion of a plastic surgeon, who will indicate the appropriate treatment. Whether it's surgery, machines, facial pairing techniques, use of threads, fillers or biostimulators.

Facial plastic surgery is recommended for people with facial aging or sagging, when you feel your face is polluted.

Polluted face is when you have difficulty seeing your features, in the sense of a lot of line, a lot of fall, or something that bothers you.

# Scared of Anesthesia?

People in general are afraid of anesthesia. However, the risk you have of dying from anesthesia is much less than the risk you have of dying in a car accident.

“ Face plastic surgery for me is synonymous with surgery in hospital, and with general anesthesia. **Dr. Múcio Porto** ”

Anesthetists are professionals who will be by your side the entire time, monitoring the anesthesia. Demystify your fear. You will be very well evaluated before and during the procedure.

# How is the face surgery?

Plastic surgeries aim to harmonize some part of the body that you don't like or that needs aesthetic correction.

A cut is made inside the hair that passes in front of the ear and goes back inside the hair. A detachment of the skin from the muscles is made up to the previously marked lines. The skin is repositioned and excess skin is removed.

The cuts are always made following the harmonization of the face, in specific points to have an excellent finish and without leaving the scars exposed. The duration of the surgery depends a lot on the complexity of the procedure and the technique used.

## procedures ancillary aesthetics

Currently, there are a number of non-surgical aesthetic procedures that help both in the harmonization of the face and in the rejuvenation and prevention of the first signs of aging.

The popularly known Botox, Hyaluronic acid which is currently the most used industrialized product for facial fillers, Calcium hydroxyapatite, a powerful filler that can be applied in different regions of the face and the support threads composed of polylactic acid.

All these products are collagen biostimulators, that is, in addition to their initial action, they also act by stimulating the dermis to become healthier and firmer.
